1.0 Introduction

Cyberbullying is a term that refers to one being bullied online; it can occur in online games, social media, or any other platform if there is an internet connection. This phenomenon has become a serious issue as the internet has become an essential part of everyone's daily life. The victims of these cyberbullies have suffered mentally, which leads to anxiety and stress. Thus, counseling plays a pivotal role in helping the victim overcome their mental health issues.

2.0 Step and Description

Log Journal

21 October	Discuss the project title of Design Thinking on group chat. The topic of mental health, which is cyberbully has been decided. The final project title is CyberCare(CC): A Smart Online Counseling Platform for Cyberbullying Victims.
14 November	Distribution of presentation slides for Design Thinking.
19 November	Present our Design thinking project to our lecture through Webex.
21 December	Distribution of every member task for the report and video of Design Thinking.
22 December- 23 December	-Design Google form to identify user experience and acknowledgement toward cyberbully. -Distribute Google form to other students.
22 December- 31 December	-Add Home, Counselor, AI Chat, About Us and Help features on the CyberCare website. -A lot of improvement has been made in terms of website background, quick button and AI Chat response. -Use Google Sites to make the website.
26 December- 1 January	Design Booking Counseling platform using Jotform. Problem : The platform doesn't update the changes that have been made. Solution : Reload the website several times, however only the developer of the Booking Counseling platform (Nurul Iman) can edit.
2 January	Testing the features of CyberCare website and booking of counseling platform through Google meet.
3 January - 4 January	Continue making our Design Thinking project slides.

3.0 Detailed descriptions

Problem

People who are suffering cyberbully often refuse to ask for help from counselors. This due to several problem that had been discussed by our team:

- 1) Concern about personal information exposure.

Due to cyberbullying, victims become more paranoid about what they share with others, especially counselors. They are concerned since some counselors record the counseling session.

- 2) Scared of being judged.

Cyberbullying may lower victims' confidence. Therefore, they tend to isolate themselves than meet people because they fear judgment.

- 3) Limited access to counselors.

Many victims thought that counselors only can be found at the hospital. Thus, most of them choose to pass it because they don't want to queue for the line and appointment.

Solution

Online platform counselors are a need to help people with mental health issues expressing their feelings. With online platforms, the victims can overcome their trauma by slowly talking with their chosen counselor about their burden without meeting physically. However, if the users are ready enough to meet their counselor, a face-to-face counseling section is also provided.

Team Working

The distribution of every member's task had been made evenly. For any problem that occurs while completing the task, members will ask for others' opinions. In conclusion, all members showed good teamwork while completing the project and managed to complete their tasks on the desired deadline.

Members	Task
Nurul Iman	Design Thinking Process, Design Thinking Assessment and Counseling Booking Section.
Nurin Natasha	Evidence each phase or process (picture and video) and Google form.
Nurul Hafizzah	Introduction, Log journal, Problem, Solution and Team Working.
Sharifah Nadiah Balqis	Design a feature to put on the website (counselor background) and video for Design Thinking.

As for the website, all members help in making it successful.

4.0 Design Thinking Assessment Points

Assessment in the Design Thinking project was conducted continuously until the end of our project.

During the empathize phase, assessment focused on getting respondent experience towards cyberbully.

In the define phase, the main problem which is privacy concern, was identified based on the insights gathered during the empathize phase which involved analyzing user's feedback.

During the ideate phase, several solutions were proposed. After evaluating, only a few related to privacy concerns were selected for further development.

During the prototype phase, the selected ideas from the ideate phase were transformed into a prototype of the CyberCare (CC) website.

During the test phase, the initial prototype of CyberCare (CC) website was evaluated to provide feedback on its features and usability.

Finally, a summative assessment was conducted at the end of the project to evaluate the overall effectiveness, functionality, and quality of the final version of the CyberCare website. Overall, the assessment showed that the website successfully met user's needs.

5.0 Design Thinking Process and Evidence

5.1 Empathy

The empathize stage was conducted through observation on social media platforms; Instagram and TikTok as well as secondary resources from the internet including online news and a survey from google form. The target users for this project are individuals who frequently experience cyberbullying, particularly teenagers and young adults. From the observations, it was found that many individuals experience emotional distress, low self-esteem, and depression. Continuous exposure to harmful content negatively impacts victims' mental health and discourages them from seeking help because of privacy concern. Furthermore, many victims do not have a secure platform to express their feelings anonymously, making it challenging for them to access emotional support. These highlight the importance of providing a safe and accessible platform that allows victims to share their experiences and receive emotional support while maintaining confidentiality.

Google Form

The figure below represents the responses collected through the Google Form survey, which supports our observations from social media and secondary sources regarding the emotional and academic impact of cyberbullying on target users.

1) Demographic information about the respondent.

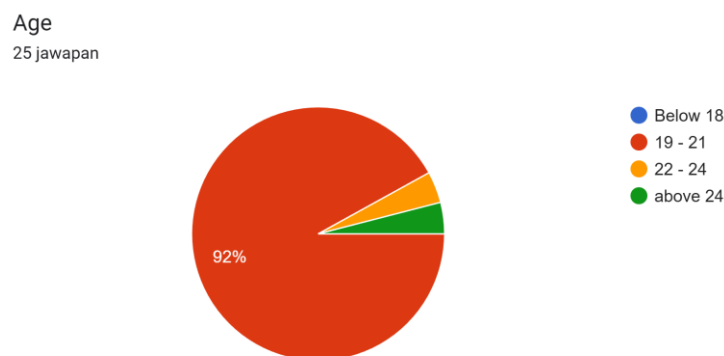

Figure 1

Gender

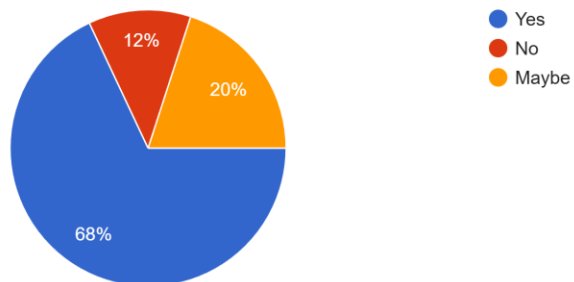

Figure 11

2. Which features would you find MOST useful?

25 jawapan

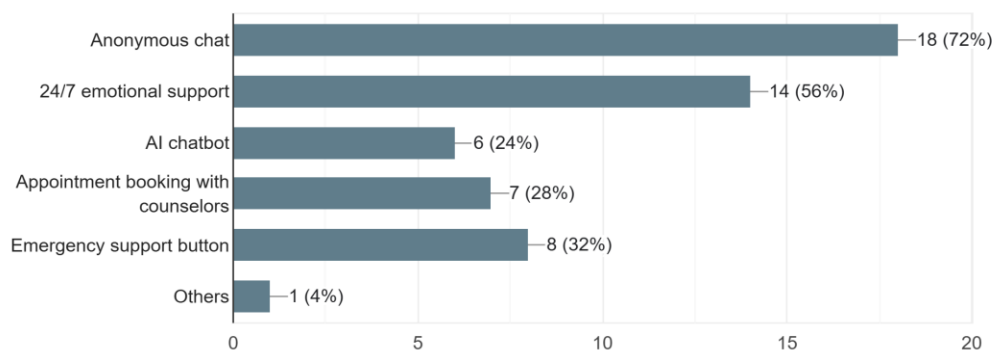

Figure 12

3. How important is anonymity in online counselling?

25 jawapan

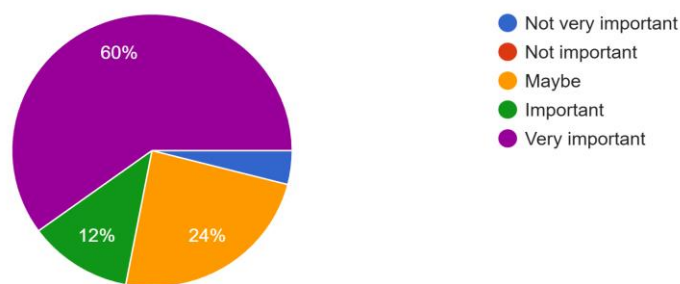

Figure 13

There are few additional features respondents would like to use in an online counselling platform.

1. Counsellors matching system. For example, match based on issue like anxiety, stress, academic pressure and so on.
2. Instant treatment suggestion.
3. Counselling session history stored securely for privacy.

Article

The figure below shows one of the articles regarding cyberbullying.

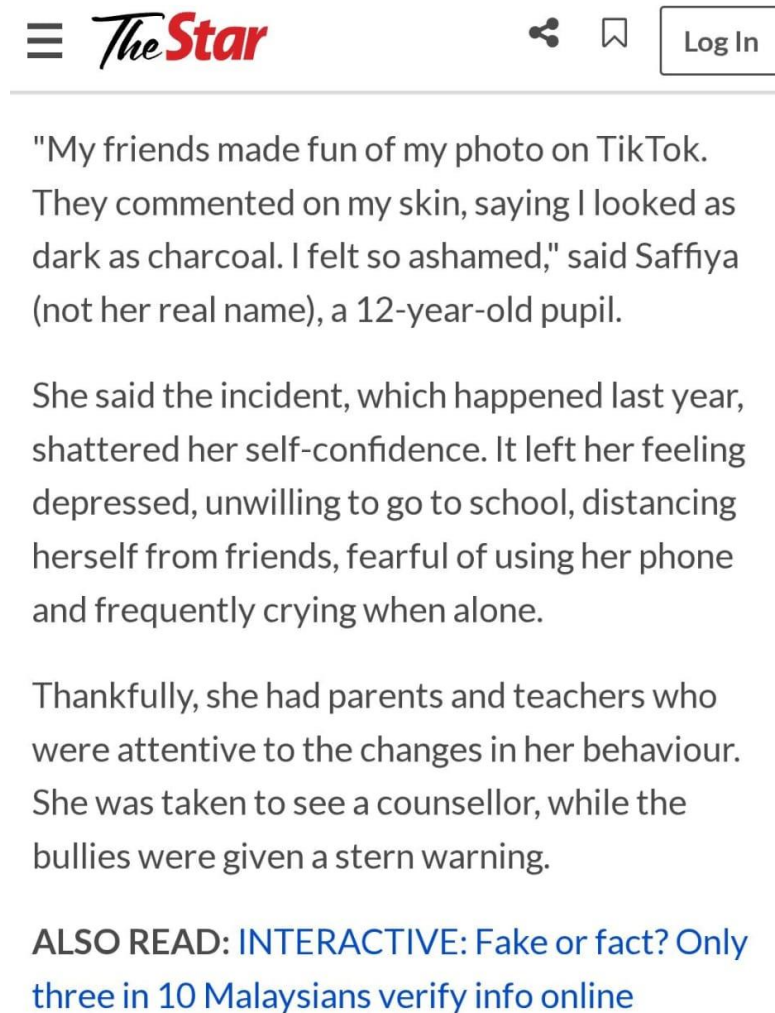

Figure 14

5.2 Define

The main problem identified is people who experience cyberbullying concerns about their personal information. Therefore, they face emotional distress, low self-esteem and depression on their own. These highlight the need for a safe and confidential platform that allows victims to share their experiences safely.

5.3 Ideate

To address the challenge faced by cyberbullying victims, several solutions were proposed. Based on the findings, brainstorming activities were carried out to explore the potential ideas that could support cyberbullying victims in a safe and confidential way. These ideas included creating a live chat support with trained counsellors, AI-powered chat for emotional support, peer support forum, self-help mental health resources and reporting and guidance features.

After evaluating, the team decided to develop a website named CyberCare(CC). The platform focuses on providing a safe anonymous online counselling service, which includes both AI-powered chat for immediate support and real counselling sessions with trained professionals' counsellors from selected institutions; ensure confidentiality, high-quality support, users safety and effectiveness emotional guidance.

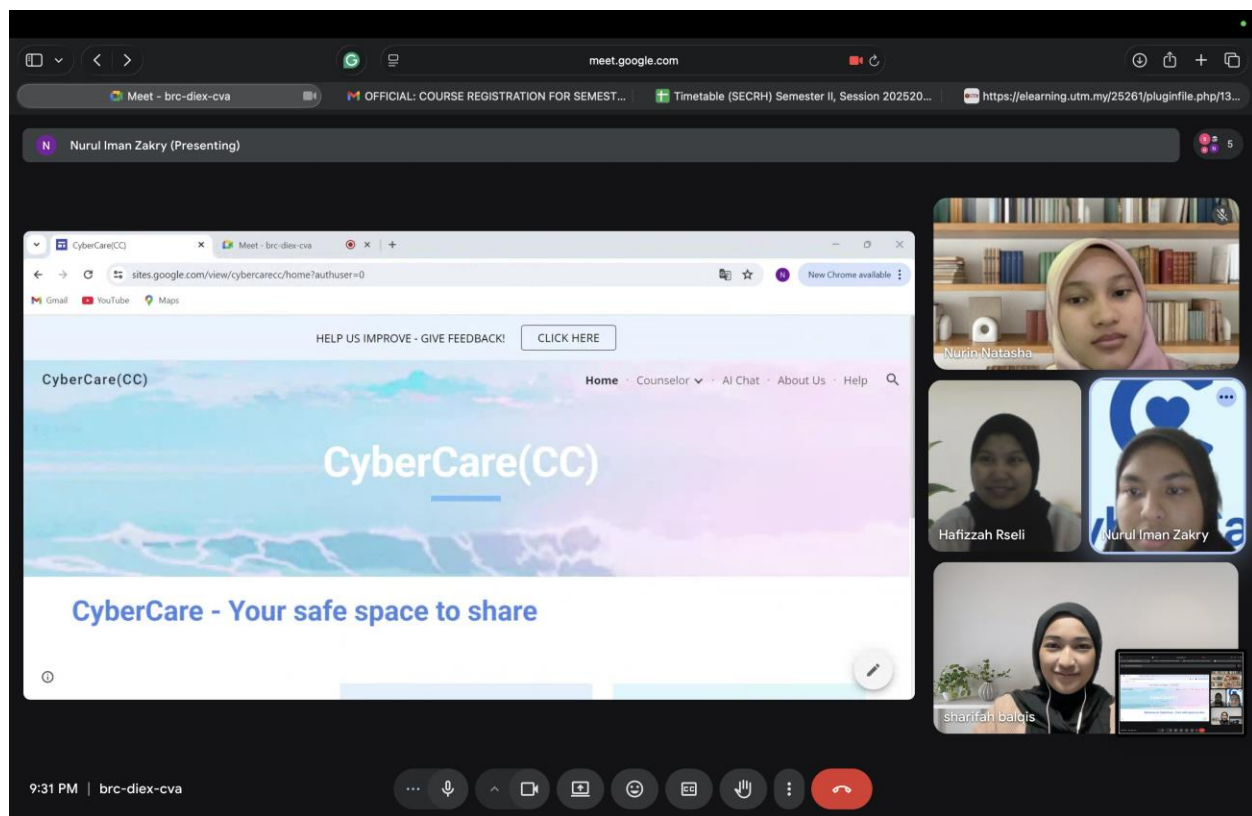

Figure 15

5.4 Prototype

The prototype of CyberCare(CC) was to visualize the design and functionality of the website. Google Sites, Jotform and Canva were used to create the website layout. The main features of the prototype include:

1. AI-powered chat available 24/7 for immediate emotional support.
2. Real counseling sessions with trained professional counsellors from selected institutions. Users can choose to receive support online via video call or face-to-face, depending on their preference.
3. Counsellor selection where users can choose counsellors based on institution, name, education background, qualification, license and location.
4. Calendar or booking system that allows users to schedule real counselling sessions according to the available slots.

About Us

CyberCare (CC) is an online platform dedicated to supporting individuals affected by cyberbullying. Our mission is to provide **accessible, confidential, and safe counselling support** through a combination of **AI chat, anonymous counsellor chat, and professional sessions**.

Figure 20

5.5 Test

The test stage was conducted to evaluate the usability, effectiveness and user satisfaction while using the CyberCare(CC) website prototype. This stage aimed to ensure that the platform is confidential, easy to navigate, and meets the needs of cyberbullying victims. CyberCare website was tested with one user. The user suggestion was creating feedback and rate form, enabling users to provide comments and rate after completing the counselling session.

6.0 Reflection

Nurul Iman:

My goal in this Computer Science (Computer Network & Security) program is to become a successful cybersecurity engineer. I aim to gain extensive hands-on experience and continuously explore deeper knowledge in cybersecurity to prepare myself for real-world challenges.

This design thinking project enhanced my problem-solving skills by teaching me a structured, step-by-step starting from understanding the problems to develop solutions. This experience supports my goal as it reflects the real process used in cybersecurity, which is starting from analyze issues to develop effective solutions in real-world situations.

To improve my potential in the industry, I plan to expand my professional network, continue learning new cybersecurity knowledge, ask question whenever I faced difficulties, and improve my communication skills for better teamwork.

Nurin Natasha :

My goal with regard to network and security is to build and manage network systems that are secure, reliable, and efficient. I want to pursue a career in cybersecurity by developing the skills needed to protect systems, networks and data from cyber threats.

Design thinking gives impact to this goal by encouraging a user-centered and problem-focused approach which allows me to understand real world needs and potential risks before implementing the solution. This ensures that network and security measures are not only technically strong but also practical and usable.

I need to continuously develop my team working skills, stay up to date with current technologies and strengthen my soft skills such as communication and problem solving to meet industry expectations in order to improve my potential in the industry.

Nurul Hafizzah :

My goal towards my program is to master all the courses that I have learned. I aim to build a strong network and computer security base as I want to pursue my ambition as a cybersecurity analyst.

This Design Thinking project has impacted my vision towards job scope in computer science related. A lot of effort is needed to make this project a success, along with tiredness. However, it doesn't make me give up, instead makes it more interesting.

Some of the improvements I had planned is to join a workshop that related to cybersecurity. I am aware that people with more additional skills tend to be picked up by a big company. I also plan to learn new language.

Sharifah Nadiah Balqis :

My goal is to become a more skilled and competent professional in the field of network and security. I aim to master the practical skills, problem-solving, and communication so that I can build a strong profile and contribute effectively in the technology industry.

Design thinking affects me by teaching me a long-term problem-solving skill that requires proper communication with teammates. This project expanded my thinking by working on real-world problems, where we narrowed the problem through continuous feedback to obtain one solution. With this, I will be able to develop more practical technological solutions in the future.

Improvement that I need is in my technical and soft skills, where I need to strengthen and deepen my knowledge in network and security, and also practice more in communicating effectively with teammates.
